## ABSTRACT

Among freshmen who entered the City University of New York (CUNY) in fall 1970, about 60 percent of the senior college enrollees and 41 percent of community college students were still enrolled or had graduated 3.5 years later. The retention-graduation rate of students with stronger high school averages was slightly higher than for those with weaker high school averages. Among students who left college, about 17 percent returned and were enrolled in the seventh semester or had graduated. High school average was positively associated with return rates. With regard to retention, graduation, and return rates, there was considerable variation among the colleges of CUNY. Comparison of the CUNY seven semester data with national eight semester data suggest that CUNY retention rates over eight semesters will be somewhat higher than has been the case nationally. (MJM)

## INTRODUCTION

Since the advent of open admissions at the City University of New York (CUNY) in 1970, student retention has been a topic of major interest, both within the university, and among the public. A recent report (Lavin and Silberstein, 1974) described retention phenomena for the first entering freshman class over the period of four semesters. That study was able to track students who transferred from their original college to another CUNY campus. It was also able to count among the retained those students who left and later returned to CUNY. As a result of these refinements, the four semester retention rates were shown to be higher than was previously thought.

However, the significance of the findings was limited by the fact that the data covered only the first two years of open admissions. This report, covering a seven semester period (ending with the fall 1973 semester) for 1970 enrollees, thus represents an updating of the previous report.

The data are presented with an important qualification: Their reliability has not been thoroughly checked beyond four semesters. We have conducted certain preliminary tests which indicate no gross errors subsequent to the fourth semester, but further checking has not been completed, nor will it be,

until October or November, 1974. While final figures may be subject to some change, the preliminary checks suggest that such changes will be minor.<sup>1</sup>

The data also incorporate certain further improvements in the University's developing student information system.<sup>2</sup> First, many students previously missing from the files have now been added. Second, we now have incorporated into our files data for three colleges (John Jay, Bronx, and Hostos) which were missing from the earlier report. Third, students who transfer from full-time matriculated status in the day session to matriculation in the evening session are now counted as retained. Fourth, information on students who have graduated has been added to the files.

Note that inter-college transfer students are tracked and counted as retained at the college of their original enrollment.

The report presents data on retention, graduation, and the phenomena of return from temporary leave. The findings are also placed in the context of national retention and graduation data.

All findings are presented in terms of the following high school average categories:

<u>High School Average</u>	<u>Senior College Label</u>	<u>Community College Label</u>
Less than 70.0%	Level B	Level B
70.0 - 74.9%	Level A.1	Level A
75.0 - 79.9%	Level A.2	Regular 1
80.0% or above	Regular	Regular 2

At senior colleges open admissions students are in the Level B, Level A.1, and Level A.2 categories. At community colleges the open admissions students are in the Level B and Level A categories. These definitions allow one to compare senior college and community college students at all levels of high school average. We also present data on students for whom no information on high school average was available. This group consists of those who attained high school equivalency diplomas, students from outside of New York City, and others for whom the data were missing. The population includes special students (e.g. SEEK and other programs.)

#### RETENTION AND GRADUATION

Data are presented in terms of three indices: retention-graduation rate, net retention-graduation rate, and graduation rate alone. The retention-graduation rate refers to those who were matriculated without interruption for seven semesters, plus those who graduated within this time period without ever leaving college. The net retention-graduation rate is defined

by those students present for all seven semesters (including graduates), plus those who left, returned, and were present at any CUNY campus in the seventh semester. This net rate also includes students who dropped out, returned and graduated. The graduation rate includes all students who graduated. The graduation data are reported for both senior and community colleges, but they are primarily meaningful for the latter, since very few students at senior colleges graduate in less than four years (due to the fact that three summer sessions occurred within the seven semester period, it is possible to graduate in less than four years).

Data on overall retention-graduation rates are presented in Table 1. For the senior colleges about 60% were still in college after seven semesters or had graduated. This was true for about 41% at the community colleges. At the latter the figure includes 22% who had graduated. For the university as a whole, 52% were either enrolled in the seventh semester or had graduated.

The data take on added significance when considered within high school average categories. Results are presented in Tables 2-6.

For Level B senior college students, Table 2 shows that the net retention-graduation rate was 39%. Among individual campuses, the net rates were highest at York, Queens, and City College. At these campuses the net retention was be-

tween 45-50%. The rates were substantially lower at Baruch, John Jay, Lehman, and Brooklyn (approximately 35%).

For Level B community college students, the net retention-graduation rate was 35% (including 14% who had graduated). Students were most likely to have graduated or still be enrolled at Manhattan Community College and at Kingsborough.

Table 3 presents results for Level A.1 students at the senior colleges. The net retention-graduation rate for these students was 46.2%. The highest rates were exhibited by York and City College, where over 50% were in attendance in the seventh semester. John Jay, Hunter, and Baruch showed lower rates (under 45%).

At the community colleges the net retention-graduation rate for Level A students was 41.8%. Kingsborough and Manhattan were the two leading schools, while students at Hostos were least likely to have graduated or to be enrolled in the seventh semester.

Data for senior college Level A.2 students are exhibited in Table 4. The net retention-graduation rate for this group was 55.8%. The highest rates occurred at Queens (61.5%) and Brooklyn (60.5%), while John Jay showed the lowest rate by far (39.4%).

For the Regular 1 students in the community colleges, Table 4 shows that 47.1% had graduated or were still enrolled. Kingsborough and Manhattan were again the colleges with the

highest rates, while Hostos had the lowest rate (28.3%).

For regular senior college students, the results are presented in Table 5. Overall, the net retention-graduation rate was 70.2%. Queens (74.2%) and Brooklyn (73.4%) showed the highest rates, while students at John Jay (57.6%) and York (57.0%) had the lowest probability of graduating or being in attendance through the seventh semester.

For the community college Regular 2 students, 54.3% had graduated or were still enrolled. Again, Kingsborough and Manhattan ranked highest on this index, while Hostos ranked lowest.

Three major points emerge from these data. First, at both senior colleges and community colleges, the retention-graduation rate is positively associated with high school average. Second, although community college students were (expectedly) more likely to have graduated than senior college students, the combined retention-graduation figures were higher for the latter. Third, there was considerable variation among colleges. The explanations for such institutional variation are presently unclear.

#### RETURN RATES

We now consider the following question: Among students who left college at any time during the first six semesters, what proportion had either returned and were present for the

seventh semester, or returned and graduated? These data are presented in Tables 7-12.

Overall findings are presented in Table 7. They show the return-graduation rate to be 17.2% for the university as a whole. The rate for the senior colleges (18.5%) was slightly higher than for the community colleges (15.9%).

Among Level B senior college students, Table 8 indicates an overall return-graduation rate of 15.2%. Among individual colleges, the highest return rates occurred at York (22.9%) and Queens (21.9%). The lowest rates were John Jay (10.0%) and Brooklyn (12.6%). Thus, a York dropout was more than twice as likely to return than a student who left John Jay.

For Level B community college students, the return-graduation rate was 13.9%. If a student left college, the likelihood that he would return and/or graduate was greatest at Manhattan and Hostos (about 20%).

Table 9 presents the data for senior college Level A.1 students. The overall rate was 15.9%. York (21.1%) again showed the highest rate of return, while John Jay (10.0%) was again lowest.

The overall rate for the community college Level A students was 14.1%. This was most likely to occur at Manhattan, where 20% of the students returned and/or graduated. The rate was lowest at New York City Community College (8.7%).

Results for Level A.2 senior college students are shown

in Table 10. Among students who left, 18.3% had returned and/or graduated by the seventh semester. York and Lehman (over 20%) had the highest rates, while Baruch (11.7%) and John Jay (12.7%) had the lowest rates.

Table 10 also indicates the return-graduation rates for the Regular 1 community college students. Overall, the rate was 15.9%. It was again highest at Manhattan. The other colleges cluster rather closely around the community college average.

Among regular senior college students, Table 11 shows the return rate to be 20.9%. York again showed the highest rate (24.6%). The rate was lowest at Baruch (14.8%).

Among community college Regular 2 students, the return-graduation rate was 18.1%. The rate was highest at Staten Island and Hostos (27.3%), and lowest at New York City (13.5%), Bronx, and Kingsborough (14.0%).

In summary, we find that high school average is positively related to return-graduation rates for both senior and community colleges. However, this association is not a strong one. The combined return-graduation rates are slightly higher at the senior colleges than at the community colleges.

#### COMPARISON OF CUNY AND NATIONAL DATA

CUNY retention and graduation data are significant for the obvious reason that they are the prime indicator of whether CUNY is attaining a key open admissions aim; avoidance of the revolving door. What is the significance of the findings pre-

sented above for this question? In the earlier Lavin-Silberstein report, the question was assessed by comparing the CUNY data with national findings presented by Astin (1972). Four semester CUNY data were compared with eight semester national data. Although the time periods were different, such a comparison was not unreasonable: it indicated the distance of CUNY from the thresholds defined by the national data. Now, with preliminary data for seven semesters, the time periods become more comparable.

The data are shown in Table 13. For the senior colleges it now appears to be a reasonable expectation that CUNY retention after eight semesters will be somewhat above the national baseline. Thus, after eight semesters nationally, 38% of students with high school averages between 70-74 were either still enrolled or had graduated. After seven semesters, 46% of CUNY students in this category were still enrolled. We believe there is now a good chance that the CUNY senior college retention rates will be somewhat higher than the national average. The one exception to this expectation concerns the Level B students (less than 70 high school average). It now appears that the retention of this group may fall at, or slightly below the national average.

The above commentary focusses upon retention, but not graduation, since senior college students would not be expected to graduate after only seven semesters. However, for the community colleges, it is useful to separate graduation rates from retention rates for

comparison purposes. Table 13 indicates that national graduation rates for two year colleges (after four years) are higher than CUNY rates after three-and-a-half years. However, the combined CUNY retention-graduation rates are higher than the national rates. This suggests that the typical CUNY pattern of attendance followed by leave or partial leave, followed by return, has become accentuated since the advent of open admissions. In addition, of course, it was expected at the outset that the college career of many CUNY students would be extended because they would be required to take remedial work generating little or no credit.

#### SUMMARY

Among freshmen who entered CUNY in Fall, 1970, about 60% of the senior college enrollees and 41% of community college students were still enrolled or had graduated three-and-one-half years later. The retention-graduation rate of students with stronger high school averages was slightly higher than it was for those with weaker high school averages. Among students who left college, about 17% returned and were enrolled in the seventh semester or had graduated. High school average was positively associated with return rates.

With regard to retention, graduation, and return rates, there was considerable variation among the colleges of CUNY.

Comparison of the CUNY seven semester data with national eight semester data suggest to us that (with the exception of senior college Level B students) CUNY retention rates over eight semesters will be somewhat higher than has been the case nationally. However, it now seems that the time required for a CUNY student to graduate will be longer than the national average.

While the success of an educational experiment as complex as open admissions can never be summarized by means of only one indicator such as retention, these findings at least suggest that many of the dire predictions of four years ago about the inevitable revolving door may well prove erroneous.

NOTE

1. In particular, a check indicates that 530 students registered for the first semester of the freshman year, but had no academic records. These students have been defined as "no shows". That is, while registering, they never attended, but were not eliminated from the records at the colleges. These students have been excluded from the report.
2. Marianne Williams, Lee Vandiver, and Arthur Clausen of the CUNY Office of Management Data have been primarily responsible for these improvements.

TABLE 13

Relation of High School Average with Retention and Graduation: Comparison  
of National and CUNY Data  
Fall 1970 Freshman Class:

4 Year Colleges		
High School Average	Received Degree <u>or</u>	Still Enrolled
	National*	CUNY**
80+	63	70
75 - 79	48	56
70 - 74	38	46
Less than 70	38	39

\* After 8 semesters

\*\* After 7 semesters

2 Year Colleges				
High School Average	Received Degree		Received Degree or Still Enrolled	
	National*	CUNY**	National*	CUNY**
80+	45	38	46	54
75 - 79	39	30	41	47
70 - 74	29	22	31	42
Less than 70	25	14	29	35

\*After 8 semesters

\*\*After 7 semesters
